Project 2 Report

The goal of this project was to create a fully functioning webpage with HTML and CSS, along with implementation of Bootstrap. For my webpage I decided to re-create an about me/resume website using a template from startbootstrap. I used VS Code as my IDE while creating the project, which made it easy to view the changes made in real time. VS Code has an option to view the HTML document within your default browser, which helped a lot. The main struggles I had while working on this was trying to properly insert images and replace text into the template. There is a lot going on in the HTML and CSS files provided with the template, so finding where exactly to make changes can be difficult sometimes. I also altered the icons at the bottom of the page, and it wasn't too easy finding which ones were actually built into Bootstrap so that I could use it. Other than these minor issues, the project was pretty smooth during implementation and I enjoyed learning more about Bootstrap.
